

I really enjoyed the Royal Institution's Mathematics Workshop-it is a great initiative as it teaches more advanced students about new and more interesting topics within Maths that would not be taught to them, usually, until a much higher level. Topics like Chaos and Mathematics of Privacy were ones I especially enjoyed learning about as it was a very different kind of Maths to what schools usually teach us. If I had to choose, my favourite session was the first one: Mathletics. I enjoyed this mostly because I like having to try solving Maths problems as fast as possible; I also enjoyed the Ian Porteous Tribute session because I found the different puzzles that were available very interesting and fun to complete. Another thing I liked learning about was fractals and infinity as I hadn't studied the subject much before and I found discovering and creating fractals really intriguing as I hadn't heard of them before. In general, the sessions were a great way to learn advanced Maths.
